Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       City, CA). The frequency distribution of the library is as follows: 72 of genes have 1 copy, 14.3% 2, 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function; 23% have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTs and 20% are unidentified."

/dev stage="most am remark"
/dev stage="post matal day 5 to 13"
/clone_lib="Mouse Organ of Corti cDNA pBluescript"
/note="Organ: Organ of Corti; Vector: pBluescript; The
organ of Corti (OC) was fine dissected from a total of 386
OC as follows: 102 samples from post-natal (P) day 5; 72
from P6; 60 from P7; 46 from P8; 18 from P9; 20 from P10;
14 from P12 and 24 from P13. After Killing animals by
cervical dislocation followed by decapitation, the bulla
was removed and opened in Leibowitz medium. The bony
capsule of the cochlea was chipped away, stria vascularis
and spiral ligament were removed and the sensory
epithelium was carefully dissected out of the modiolus.
Total RNA was extracted using the micro Fasttrack kit
                                                                                                                                                    BUJ568498 514 bp mRNA linear EST 19-JUN-2002 gil09c02.yl Mouse Organ of Corti cDNA pBluescript Mus musculus cDNA clone gil09c02 5', mRNA sequence.

(catalog # K1593-02; Invitrogen, Carlsbad, CA), according to manufacturer's instructions. Reverse transcription and library construction were carried out with the Uni-Zap XR vector kit (catalog # 237612), Stratagene) and Uni-Zap XR Gigapack III Gold Cloning kit (catalog # 237612), both from Stratagene (La Jolla, CA, USA), according to manufacturer's instructions. Briefly: 1.5 ug mRNA was reverse transcribed using a hybrid oligo(dT) linker-primer that contains an Xho I site. First strand synthesis was primed with the linker- primer and transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using Moloney murine leukemia virus reverse transcribed using synthesized with DNA polymerase and RNAse H. Complementary DNA was blunt ended with PFU DNA polymerase, ligated with EcoR I adapters in the presence of ligase and digested with Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA) columns to enrich for cDNAs greater than 400bp and 1000 bp. respectively. The cDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with BcoR I and XRh O I. The phagemid was packaged with Gagapak III Gold and, upon titration on XI Blue MRF' cells, the yield of the phage library was estimated to be 11,100,000 recombinants: Stratagene's Exassist Interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the restatance helper phage (CAGGAAAGCTARAGCTARAGCC) and control of the converse of the manufacturer. ESTS from the S' end of the converse milverse MI as instructed by the manufacturer. (AMA CAGGAAGCTARAGCC) at render the strander of the converse m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                strength BigDye terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MJ Tetrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POPS polymer (Applied Biosystems, Roster City, CA). The frequency distribution of the library is as follows: 72% of genes have I copy; 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function; 23% have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTs and 20% are unidentified."

/clone_lib="mouse Organ of Corti; Vector: pBluescript; The
organ of Corti; Occ) was fine dissected from a total of 386
OC as follows: 102 samples from post-natal (P) day 5; 72
from P6; 60 from P7; 46 from P8; 18 from P9; 20 from P10;
14 from P12 and 24 from P13. After killing animals by
cervical dislocation followed by decapitation, the bulla
was removed and opened in Leibowitz medium. The bony
capsule of the cochlea was chipped away, stria vascularis
and spiral ligament were removed and the sensory
capsule of the cochlea was chipped away, stria vascularis
and spiral ligament were removed and the sensory
catalog # K1593-02; Invitrogen, Carlsbad, CA), according
to manufacturer's instructions. Reverse transcription and
library construction were carried out with the Uni-Zap XR
vector kit (catalog # 237211, Stratagene) and Uni-Zap XR
vector kit (catalog # 237211, Stratagene) and Uni-Zap XR
vector kit (catalog # 237211, Stratagene) and Uni-Zap XR
cigapack III Gold Cloning kit (catalog # 237212), both
from Stratagene (La Jolla, CA, USA), according to
manufacturer's instructions. Briefly: 1.5 ug mRNA was
reverse transcribed using a hybrid oligod(d7) linker-primer
that contains an Xho I site. First strand synthesis was
primed with the linker- primer and transcribed using
Noloney mutine leukemia virus reverse transcriptase
(MMLV-RT) and 5-methyl drTP. The second strand was
synthesized with DNA polymerase and RNase H. Complementary
DNA was blunt ended with PFU DNA polymerase, ligated with
EcoR I adapters in the presence of ligase and digested
with Xho I. The cDNA was sequentially size fractionated
over Pharmacia Size Sep400 (Pharmacia, Uppsala, Sweden)

and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA) columns to enrich for CDNAs greater than 400bp and 1000 bp , respectively. The CDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with EcoR I and Xho I. The phagemid was packaged with Gigapak III Gold and, upon titration on XLI Blue MRF' cells, the yield of the phage library was estimated to be 11,100,000 recombinants. Stratagene's ExAssist Interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the rescued library, individual cDNA clones were selected and grown in 96-well, 2 ml growth plate. Plasmid DNA was purified from 200 ulof saturated culture with the Concert96(TM) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer. ESTS from the 5' end of the cDNA clones were generated with the universal ML3 reverse primer (CAGGAAACAGCTATGACC) and 25% strength BigDye terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MU Tetrad thermal cyclers (MI Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POPS polymer (Applied Biosystems, Foster City, CA). The frequency distribution of the library is as follows: 72% of genes have I copy, 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function; 23% have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTS and 20% are unidentified."

library construction were carried out with the Uni-Zap XR glgapack III Catalog # 237211, Stratagene) and Uni-Zap XR glgapack III Catalog # 237211, Stratagene) and Uni-Zap XR glgapack III Catalog # 237211, Stratagene) and Uni-Zap XR glgapack III Catalog Glob Cloning kit (catalog # 237612), both from Stratagene (La Jolla, CA, USA), according to manufacturer's instructions. Briefly: 1.5 up mRNA was primed by the contains an XNo I site. First strand synthesis was primed with the linker- primer and transcribed using knoloney mutine leukemia virus reverse transcribed using sprimed with the linker- primer and transcribed using knoloney mutine leukemia virus reverse transcribed using sprimed with the linker- primer and transcribed using knoloney mutine leukemia virus reverse transcribed using sprimed with the Daylymerase and RNase H. Complementary DNA was blunt ended with PRO plymerase and RNase H. Complementary BCOR I adapters in the presence of ligase and digested with ECOR I adapters in the presence of ligase and digested with ECOR I adapters in the presence of ligase and digested virus respectively. The cDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with ECOM INION OF CAP COLOUMNS to enrich for CDNAS greater than 400bp and 1000 bp. respectively. The phagemid was packaged with digapak III Gold and, upon titration on XII Blue WRF. Calls. the vector which had been predigested with the restablance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the commin 95 werl of prowth plate. Plasmid DNA was purified from 200 ul of saturated outlure with the Concert96(TM) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer ESTS from the 5' end of the CDNA clones were generated with the 5' end of the CDNA clones were generated anily sequencers using poots polymer (Applied Biosystems, Roster Cliv, CA). The frequency distribution of the CDNA carlsbad, CA) as instructed by the manufacturer of the DNA clones h

/done lib= Mouse Organ of Corti cDNA pBluescript. |
/done lib= Mouse Organ of Corti cDNA pBluescript. The
/done corti (OC) was fine dissected from a total of 386
OC as follows: 102 samples from post-natal (P) day 5; 72
from Pof; 60 from P7; 46 from P8; 18 from P9; 20 from P10;
14 from P12 and 24 from P13. After killing animals by
cervical dislocation followed by decapitation, the bulla
was removed and opened in Leibowitz medium. The bony
capsule of the cochlea was chipped away, stria vascularis
and spiral ligament were removed and the sensory
epithelium was carefully dissected out of the modiolus.
Total RNA was extracted using the micro Fastrack kit
(catalog # K1993-02; Invitrogen, Carlsbad, CA), according
to manufacturer's instructions. Reverse transcription and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                608

was removed and opened in Leibowitz medium. The bony capaule of the cochlea was chipped away, stria vascularis and spiral ligament were removed and the sensory population of the cochlea was chipped away. Stria vascularis and spiral ligament were removed and the sensory fortal RNA was extracted using the micro Fastrack kit related to the modicious of the manufacturer's instructions. Reverse transcription and library construction were carried out with the Uni-Zap XR vector kit (catalog # 237612), buth from Stratagene [La Jolla, CA UGA), according to manufacturer's instructions. Bynchesized with DAM polymerase, incomparation by was blunt ended with Pfu DNA polymerase, ingated with Brown in day of the content and incompared over Pharmacia Size Sep400 (Pharmacia, Uppsala, Sweden) and Clontech Chroma Spin.1000 (Clontech, Palo Alto, CA) columns to enrich for CDNA greater than 400bp and 1000 bp , respectively. The CDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with Gigapak III Gold and, upon titration on XLI Blue MRF, cells, the yield of the phage library was estimated to be 11,100,000 recombinants. Stratagene's Exassist Interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the rescued library, individual cDNA clones were selected and grown in 96-well, 2 ml growth plate. Plasmid DNA was purified from 200 ul of saturated culture with the Concert9(TW) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer. ESTs from the 5' end of the cDNA clones were generated with the universal M13 reverse primer (GAGGAAACAGCTAAGAC) Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MJ Terrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POS5 polymer (Applied Biosystems, Poster City, CA).

City, CA). The frequency distribution of the library is as follows: 72 of genes have I copy; 14.3% 2; 12% 310; 1.4% 11-50 and 0.18 51-50. As to gene function, 23% have micharacterized ESTs and 20% are unidentified."

library construction were carried out with the Uni-Zap XR octor kit (catalog # 23721, Stratagene) and Uni-Zap XR digapack III Gold Cloning kit (catalog # 237612), both from Stratagene (La Jolla, CA, USA), according to manifacturer's instructions Briefly: 15 up mRNA was manifacturer's instructions Briefly: 15.0 up mRNA was reverse transcribed using a hybrid oligo(dT) linker-primer that contains an XND I site: First strand synthesis was primed with the linker- primer and transcribed using Moloney murine leukemia virus reverse transcriptase (WMLV-RT) and 5-methyl dCTP. The second strand was synthesized with DNA polymerase and RNase H. Complementary DNA was blunt ended with PK pNA polymerase, ilgated with EcoR I adapters in the presence of ligase and digested with XND I. The CDNA was sequentially size fractionated over Pharmacia Size Septo0 (Pharmacia, Uppsala, Sweden) and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA) columns to enrich for CDNA spreater than 4000b and 1000 bp. respectively. The CDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with EcoR I and XiD I. The phagemid was packaged with diapapak III Gold and, upon titration on XiL Blue NRF cells, the yield of the phage library was estimated to be 11,100,000 recombinants. Stratagene's Exassist Interference the phage library was estimated to be 11,100,000 recombinants. Stratagene's Exassist Interference helper phage (catalogue # 211203) was adopted to resume plasmid DNA from the phages. Upon plating of the resumed library, individual cDNA clones were selected and grown in 96-well, 2 and growth plate. Plasmid DNA was purified from 200 ul of seturated culture with the Concert96 (TW) plasmid purification kit (Invitrogen, Carlebad, CA) as instructed by the manifacturer. Est form the 5 end of the CDNA clones were generated with the 5 end of the CDNA clones were generated with the 5 end of the CDNA clones were generated with the 5 end of the CDNA clones were generated with Waltham WA), and analyzed on 3700 automated ca

(catalog # K1593-02; Invitrogen, Carlebad, CA), according to manufacturer's instructions. Reverse transcription and library construction were carried out with the Uni-Zap XR vector kit (catalog # 23721, Stratagene) and Uni-Zap XR Gigapack III Gold Cloning kit (catalog # 237612), both from Stratagene (La Volla, CA, USA), according to manufacturer's instructions. Briefly: 1.5 ug mRNA was reverse transcribed using a hybrid oligo(dT) linker-primer that contains an Xho I site. First strand synthesis was primed with the linker- primer and transcribed using Moloney mutine leukemia virus reverse transcribates (MMLV-RT) and 5-methyl GCTP. The second synthesis was synthesized with DNA polymerase and RNase H. Complementary DNA was blunt ended with Pfu DNA polymerase, ligated with EcoR I adapters in the presence of ligase and digested with Stor I. The CDNA was sequentially size fractionated over Pharmacia Size Seph400 (Clontech, Ppla Alto, CA) columns to enrich for CDNAs greater than 400b and 1000 by respectively. The cDNA was then directionally ligated to the Uni-Zap XR vector, which had been predigested with EcoR I and Xho I. The phagemid was packaged with digapak III Gold and upon titration on XID Blue MRF. cells, the yield of the phage library was estimated to be 11,00,000 recombinants. Stratagene's ExAssist Interference resistance helper phage (catalogue # 21203) was adopted to resure plasmid DNA from the phages. Upon plating of the resure plasmid DNA from the phages. Upon plating of the created library individual cDNA clones were selected and grown in 96-well, 2 ml growth plate, Plasmid DNA were generated with the Concert96(TW) plasmid purification kit (Invitrogen, with the S end of the cDNA clones were generated with the universal MN1 reverse primer (GAGGAAAGGCTPARGACTPARGACC) as instructed by the manufacturer. ESTS from the S end of the conservent without parties of the phage in the prese generated with the universal MN1 reverse primer (GAGGAAAGGCTPARGACTPARGACC) and 25% and 25% and 25% and 25% and 25% and 25% and strength BigDye terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on My Tetrad thermal cycles (WM sesearch, Maltham, MA), and analyzed on 3700 automated capillary sequencers using POPS polymer (Applied Biosystems, Foster City, CA). The frequency distribution of the library is as follows: 72% of genes have a copy; 14.3% 2; 12% 3-10; 1.4% 11.50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function; 23% have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTs and 20% are unidentified."

and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA)
columns to enrich for CDNAs greater than 400bp and 1000 by
respectively. The CDNA was then directionally ligated to
the Uni-ZAP XR vector, which had been predigested with
ECOR I and Xho I. The phagemid was packaged with Gigapak
III Gold and, upon titration on Xil Blue MRF cells, the
yield of the phage library was estimated to be 11.00,000
recombinants. Stratagene's ExAssist Interference
resistance helper phage (catalogue # 211203) was adopted
to rescue plasmid DNA from the phages. Upon plating of the
rescued library, individual cDNA clones were selected and
grown in 96-well, 2 ml growth plate. Plasmid DNA was
purified from 200 ul of saturated culture with the
concert96(TM) plasmid purification kit (Invitrogen,
carlsbad, CA) as instructed by the manufacturer. ESTF from
the 5' end of the CDNA clones were generated with the
universal M13 reverse primer (CAGGAAACAGCTATGACC) and 25%
strength BigDye terminator sequencing chemistry (Applied
Blosystems, Foster City, CA). Sequencing reactions were
performed on MJ Tetrad thermal cyclers (MV Research,
Waltham, MA), and analyzed on 3700 automated capillary
sequencers using POS5 polymer (Applied Blosystems, Foster
City, CA). The frequency distribution of the library is
as follows: 72% of genes have I copy, 14.3% of
genes have hits in GenBank and have know function, 23%
have hits in GenBank. 1 the here

// Gram of Corti (OC) was fine dissected from a total of 386
OC as follows: 102 samples from ps: 18 from ps; 20 from pl);
// If from Pt: 66 from ps: After killing animals by
cervical dislocation followed by decapitation, the bony
capsule of the cochlea was chipped away, stria vascularis
and spiral ligament were removed and the sensory
epithelium was carefully dissected out of the modiolus.
Total RNA was extracted using the micro Fastkrack kit
(catalog # Ki59:02: Invitrogen, Carlabad, CA), according
to manufacturer's instructions. Reverse transcription and
library construction were carried out of the Uni-Zap XR
vector kit (catalog # 237611, Stratagene) and Uni-Zap XR
vector kit (catalog # 237211, Stratagene) and Uni-Zap XR
vector kit (catalog # 237612), according to
manufacturer's instructions. Briefly: 1.5 ug mRNA was
reverse transcribed using a hybrid oligo(dT) linker-primer
that contains an Xho I site. First strand synthesis wis
primed with the linker- primer and transcribed using
Moloney murine leukemia virus reverse transcribed with
Moloney murine leukemia virus reverse transcribed with
EcoR I adapters in the presence of ligase and digested
vir Xho I. The CDNA was sequentially size fractionated
over Pharmacia Size Septo0 (Pharmacia, Uppsala, Sweden)
and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA)
columns to enrich for cDNA was requentially size fractionally ligated the biage library was setimated to be 11,100, on
respectively. The CDNA was restimated to be 11,100, on
recombinants. Stratagene's Exabasist Interference

Upon plating of the rescued library, individual cDNA clones were selected and grown in 56-well, 2 ml growth plate. Plasmid DNA was purified from 200 ul of saturated culture with the Concert96(TM) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer. ESTs from the 5' end of the cDNA clones were generated with the universal M13 reverse primer (CAGGAAACAGCTATGACC) and 25%
                                                                                                                                                                                                                                                               EST analysis of gene expression in the mouse Organ of Corti at the

strength BigDye terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MJ Tetrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POP5 polymer (Applied Biosystems, Foster City, CA). The frequency distribution of the library is as follows: 72% of genes have 1 copy; 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function, 23% have bits in GenBank, but do not have assigned function; 12% are uncharacterized EGTs and 20% are unidentified."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TyrPheProArgAsnLeuValLysGluGlnArgValTyrGlnGluAlaThrLysGluVal 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes novel MLP proteins and their encoding DNAs. The MLP proteins and DNAs have antiinflammatory and cardiant extivities, and can be used in gene therapy and as secretory calls the function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. AAFS9063 to AAFS9099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes novel MLP proteins and their encoding DNAs. The MLP proteins and DNAs have antiinflammatory and cardiant activities, and can be used in gene therapy and as secretory call function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. AAF59063 to AAF59099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          55 CATGGAATATTTATGGACCGTCTAGCTTCCAAGAAGCTCTGTGCAGATGATGAGTGTGTC 114

The invention relates to an isolated novel secreted polypeptide (I) and polymucleotide (II). (I) and (II) are useful for treating cancer, autoimmune diseases, wound healing disorder, infections, haematopoietic disorders, inflammatory disorders, infections, haematopoietic psychiatric diseases, cardiovascular diseases, respiratory diseases, creat diseases, anormalities and disorders caused by abnormal expression, production, function and/or metabolism of the genes, as vaccines for inducing immunological response in a mammal, and in screening methods for detecting the effect of added compounds on the production of mRNA and polypeptide in cells. The polypeptides can be used as immunogens to produce antibodies immunospecific for the polypeptides, as immunogens to produce antibodies immunospecific for the polypeptides, as immunogens and diagnostic reagents, in chromosome localisation studies, and in tissue expression studies. The present sequence represents the coding sequence of novel human secreted protein #12.

The present sequence is that of Hyseq clone identification number 16372225, which was obtained from a human thymus cDNA library using standard PCR with primers specific for vector sequences flanking the inserts, sequencing by hybridisation sequence some passembly of a full-length expressed sequence tag was used in the assembly of a full-length cDNA sequence (see AAH5634) encoding a novel human growth could be some protein family as growth regulatory proteins, pelongs to the same protein family as growth regulatory proteins, growth factors, human melanoma derived growth regulatory protein precursor (64% similarity and 45% identity over 111 amino acids) or melanoma inhibitory activity, cattle cartilage-derived retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid-sensitive proteins. GTLP polypeptides and polymucleotides of the invention can be used in the prophylaxis, treatment (including gene therapy) cartilage development and maintenance, inhibition of melanoma cell growth and tumours, including neuroectodermal tumours such as glomas. The polymucleotides can also be used to design probes and primers for chromosome and gene mapping, in the recombinant production of protein, in the generation of antisense, ribozyme and peptide-nucleic acid molecules, and to produce transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AsnValLysLysGlyGlnGlnIleTyrValTyrSerLysLeuValLysGluAsnGlyAla

WPI; 2002-090516/12. P-PSDB; ABB84996 One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal

Claim 2; Fig 359; 565pp; English.

ABBBS5003. The PRO proteins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polymucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABLB8259 to ABLB8267 represent primers and probes used in the exemplification of the present invention. ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encoding PRO polypeptides.

Encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for treating a PRO related disorder. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in perioyte cells, for stimulating the proliferation or differentiation of chondrocyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating to inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABK31356-ABK33657 represent human process.
                                                                                                                                                                                                          One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumours such as lung cancer, colon cancer, breast tumour, prostate tumour, rectal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TyrPheProArgAsnLeuValLysGluGlnArgValTyrGlnGluAlaThrLysGluVal 100

                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, veast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, from the organism of interest. They can be used in diagnostics, biodiversits, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a CDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a novel nucleic acid that was assembled from human thymus CDNA library-derived Hyseq clone identification number 16372272 (see AAH26341). A recursive algorithm was used to extend the clone by pulling additional sequences from different databases. A full-length sequence (see AAH26343) encoding novel human growth regularory-like polypeptide (GRLP, see AAB82671) was subsequently obtained. Human GRLP belongs to the same protein family as growth regulatory proteins, prouth factors, human melanoma derived growth regulatory protein precursor (64% similarity and 45% identity over 111 amino acids) or melanoma inhibitory activity, cattle carilage-derived retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid sensitive protein (CD-RAP, 44% identity and 64% similarity over 126 amino acids) and other retinoic acid sensitive protein (CD-RAP, 44% identity and 64% can be used in the prophylaxis; treatment (including gene therapy) and diagnosis of disorders and diseases caused by, or involving, cartilage development and maintenance, inhibition of melanoma celling and primers, for chromosome and gene mapping, in the recombinant and arithmers, for chromosome and gene mapping, in the recombinant and arithmers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            production of protein, in the generation of antisense, ribozyme and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes novel MLP proteins and their encoding MDAS. The MLP proteins and DNAs have antiinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis. AAFS9063 to AAFS9099 and AAB69122 to AAB69132 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                        TyrThr11eSerLeualaSerAlaGlnGluAspTyrAsnAlaProAspCysArgPhe11e

Arterburn MC,

Isolated human growth regulatory-like polypeptide useful for treating e.g. Alzheimer's disease, cancer, autoimmune disorders, hyperproliferative disorders, coagulation disorders, and nervous system disorders

Claim 1; Page 115-116; 119pp; English.

the present sequence is that of a novel nucleic acid encoding human growth regulatory-like polypeptide (GRLP, see AAB82671).
The sequence was assembled using human thymus cDNA library-derived Hyseq clone identification number 16372272 (see AAH26341) as seed, using software programs to pull additional sequences from Hyseq's proprietary database containing expressed sequences from Hyseq's and by gel sequencing using primers to extend both 5' and 3' ends. The predicted protein has a mol.wt. of 14 kDa unglycosylated. GRLP, belongs to the same protein family as growth regulatory proteins, prought factors, human melatoma derived growth regulatory proteins, prought factors, human melatoma derived growth regulatory protein precursor (64% similarity and 45% identity over 111 amino acids) con melanoma inhibitory activity, cattle cartilage-derived cretinoic acid sensitive protein (CD-RAP, 44% identity and 64% imminoterial cartilage-derived cretinoic acid sensitive protein (CD-RAP, 44% identity and 64% imminoterial and diagnosis of disorders and other retinoic acid-sensitive and diagnosis of disorders and diseases caused by, or involving, and diagnosis of disorders and diseases caused by, or involving, and diagnosis of disorders and diseases caused by, or involving, and primers, for chromosome and gene mapping, in the recombinant production of protein, in the generation of antisense, ribozyme and peptide-nucleic acid molecules, and to produce transgenic animals. They may also have cytokine and cell proliferation or animals. They may also have cytokine and cell proliferation or involvity, haematopolesis regulating activity, tissue growth activity, and trivity, inhibin activity, and memorparity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activit activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, use in cancer diagnosis and therapy, drug screening, receptor/ligand activity, antiinflammatory activity, and treatment of leukaemia, nervous system disorders, arthritis and inflammation.

DNAS. The MLP proteins and DNAs have antiinflammatory and cardiant activities, and can be used in gene therapy and as secretory cell function regulators. The MLP proteins and DNAs can be used in drugs, in the diagnosis and development of promoters and inhibitors for preventing or treating bone and joint diseases as well as pathologic angiogenesis.

AAFS9063 to AAFS9099 and AAB69122 to AAB69132 represent sequences used
